

# Evaluation of Neural Object Detection Models for Human Detection in Infrared Images

PROJECT REPORT T1000

from the course of studies Computer Science - Artificial Intelligence

at the Cooperative State University Baden-Württemberg  
Ravensburg Campus Friedrichshafen

by

Lukas Florian Richter

|-------------|-----------------------------------|
| <b>API</b>  | Application Programming Interface |
| <b>HTTP</b> | Hypertext Transfer Protocol       |
| <b>REST</b> | Representational State Transfer   |

## Glossary

|                      |  |
|----------------------|--|
| <b>Exploit</b>       | An exploit is a method or piece of code that takes advantage of vulnerabilities in software, applications, networks, operating systems, or hardware, typically for malicious purposes. |
| <b>Patch</b>         | A patch is data that is intended to be used to modify an existing software resource such as a program or a file, often to fix bugs and security vulnerabilities.                       |
| <b>Vulnerability</b> | A Vulnerability is a flaw in a computer system that weakens the overall security of the system.  |

## **1 Introduction**

Introduces the problem of human detection in thermal images and the importance of infrared surveillance systems for security applications. Outlines the thesis objectives and structure.

## **2 Literature Review and Theoretical Background**

Reviews existing object detection methods, focusing on SSD architectures, and examines previous work on thermal image processing and human detection in infrared imagery.

### **2.1 Object Detection Fundamentals**

Covers basic principles of computer vision and object detection, including traditional methods and deep learning approaches.

### **2.2 Single Shot MultiBox Detector (SSD) Architecture**

Detailed explanation of SSD model architecture, including backbone networks (VGG, ResNet) and detection mechanisms.

### **2.3 Thermal Image Processing**

Discusses characteristics of thermal images, preprocessing techniques (inversion, edge enhancement), and challenges specific to infrared imagery.

## 3 Methodology

Describes the experimental setup, datasets used, model configurations, and evaluation metrics employed in the study.

### 3.1 Dataset Description

Details the thermal image datasets (FLIR ADAS v2, AAU-PD-T, OSU-T, M3FD, KAIST-CVPR15) and their characteristics.

### 3.2 Model Implementation

Explains the implementation of SSD models with different backbones and preprocessing configurations.

### 3.3 Experimental Design

Outlines the systematic approach to comparing model variants and the evaluation framework.

## **4 Results and Analysis**

Presents comprehensive results from model training and evaluation, including performance comparisons across different configurations.

### **4.1 Training Performance**

Reports training loss curves, convergence behavior, and computational requirements for different model variants.

### **4.2 Detection Accuracy Analysis**

Provides detailed mAP scores and detection performance metrics for each model configuration and preprocessing technique.

### **4.3 Preprocessing Impact Evaluation**

Analyzes the effects of image inversion and edge enhancement on detection performance.

## 5 Discussion

Interprets the results, discusses the practical implications for surveillance systems, and addresses limitations of the current approach.

### 5.1 Model Performance Comparison

Compares SSD-VGG and SSD-ResNet performance and discusses trade-offs between accuracy and computational efficiency.

### 5.2 Practical Deployment Considerations

Discusses real-world application scenarios and system requirements for thermal surveillance.

## **6 Conclusion and Future Work**

Summarizes key findings, contributions to the field, and suggestst directions for future research in thermal image human detection.

## 7 Examples

Just a couple of examples to demonstrate proper use of the typst template and its functions.

### 7.1 Acronyms

Use the `acr` function to insert acronyms, which looks like this Hypertext Transfer Protocol (HTTP).

Application Programming Interfaces are used to define the interaction between different software systems.

REST is an architectural style for networked applications.

### 7.2 Glossary

Use the `gls` function to insert glossary terms, which looks like this:

A Vulnerability is a weakness in a system that can be exploited.

### 7.3 Lists

Create bullet lists or numbered lists.

- This
  - is a
  - bullet list
- 
1. It also
  2. works with
  3. numbered lists!

## 7.4 Figures and Tables

Create figures or tables like this:

### 7.4.1 Figures

Figure 1 — Image Example

### 7.4.2 Tables

|                 | Area                                  | Parameters   |
|-----------------|---------------------------------------|--|
| cylinder.svg    | $\pi h \frac{D^2 - d^2}{4} \quad (1)$ | $h$ : height<br>$D$ : outer radius<br>$d$ : inner radius |
| tetrahedron.svg | $\frac{\sqrt{2}}{12} a^3 \quad (2)$   | $a$ : edge length  |

Table 1 — Table Example

## 7.5 Code Snippets

Insert code snippets like this:

```
1  const ReactComponent = () => {  
2    return (  
3      <div>  
4        <h1>Hello World</h1>  
5      </div>  
6    );  
7  };  
8  
9  export default ReactComponent;
```

Listing 1 — Codeblock Example

## 7.6 References

Cite like this International Organization for Standardization [1]. Or like this [1].

You can also reference by adding <ref> with the desired name after figures or headings.

For example this Table 1 references the table on the previous page.

## 8 Conclusion
